

Teams & Enterprise

SSO

Overview

SAML 2.0 SSO is available at no additional cost on Teams and Enterprise plans. Use your existing identity provider (IdP) to authenticate team members without separate Cursor accounts.

Prerequisites

- Cursor Team plan
- Admin access to your identity provider (e.g., Okta)
- Admin access to your Cursor organization

Configuration Steps

1 Sign in to your Cursor account

Navigate to cursor.com/dashboard/settings with an admin account.

2 Locate the SSO configuration

Find the "Single Sign-On (SSO)" section and expand it.

3 Begin the setup process

Click the "SSO Provider Connection settings" button to start SSO setup and follow the wizard.

4 Configure your identity provider

In your identity provider (e.g., Okta):

- Create new SAML application
- Configure SAML settings using Cursor's information
- Set up Just-in-Time (JIT) provisioning

5 Verify domain

Verify the domain of your users in Cursor by clicking the "Domain verification settings" button.

Identity Provider Setup Guides

For provider-specific setup instructions:

Identity Provider Guides

Setup instructions for Okta, Azure AD, Google Workspace, and more.

Additional Settings

- Manage SSO enforcement through admin dashboard
- New users auto-enroll when signing in through SSO
- Handle user management through your identity provider

Multiple domains

To handle multiple domains in your organization:

1. **Verify each domain separately** in Cursor through the domain verification settings
2. **Configure each domain** in your identity provider
3. Each domain needs to go through the verification process independently

Troubleshooting

If issues occur:

- Verify domain is verified in Cursor
- Ensure SAML attributes are properly mapped
- Check SSO is enabled in admin dashboard
- Match first and last names between identity provider and Cursor
- Check provider-specific guides above
- Visit the [SSO help center](#) if issues persist
