

## Integrations

## GitHub

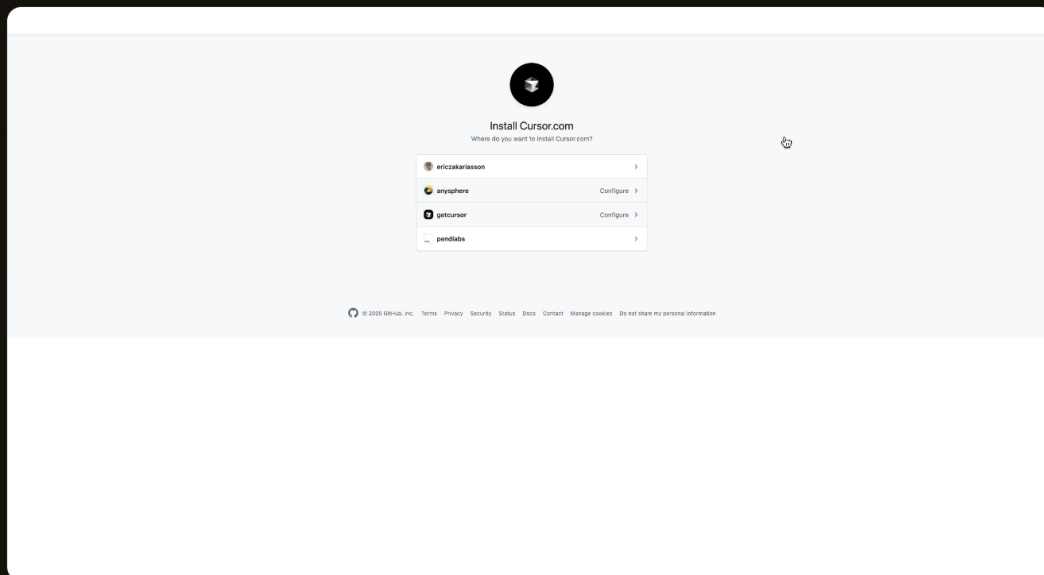

The Cursor GitHub app connects your repositories so you can use features like Cloud Agents and Bugbot.

## Setup

[GitHub.com](#)[GitHub Enterprise Server](#)

Requires Cursor admin access and GitHub org admin access.

1. Go to [Integrations in the dashboard](#)
2. Click **Connect** next to GitHub (or **Manage Connections** if already connected)
3. Choose **All repositories** or **Selected repositories**
4. Return to the dashboard to configure features on your repositories

To disconnect your GitHub account, return to the integrations dashboard and click **Disconnect Account**.

## IP allow list configuration

If your organization uses GitHub's IP allow list feature to restrict access to your repositories, Cursor can be configured to use a hosted egress proxy with a narrow set of IPs.

Before configuring IP allowlists, contact [hi@cursor.com](mailto:hi@cursor.com) to enable this feature for your team. This is required for either configuration method below.

## Enable IP allow list configuration for installed GitHub Apps (recommended)

The Cursor GitHub app has the IP list already pre-configured. You can enable the allowlist for installed apps to automatically inherit this list. This is the **recommended approach**, as it allows us to update the list and your organization receives updates automatically.

To enable this:

1. Go to your organization's Security settings
2. Navigate to IP allow list settings

2. Navigate to IP allowlist settings

3. Check "Allow access by GitHub Apps"

For detailed instructions, see [GitHub's documentation](#).

### Add IPs directly to your allowlist

If your organization uses IdP-defined allowlists in GitHub or otherwise cannot use the pre-configured allowlist, add the proxy IPs listed in [Git egress proxy](#) and [IP allow list](#).

## Advanced networking

Self-hosted instances support multiple connection methods beyond IP whitelisting.

- PrivateLink (AWS) or Private Service Connect (GCP) 
- Reverse Proxy Tunnel 

## Permissions

The GitHub app requests the following permissions to support Cursor features:

| Permission            | Purpose                                        |
|-----------------------|------------------------------------------------|
| Repository access     | Clone your code and create working branches    |
| Pull requests         | Create PRs and leave review comments           |
| Issues                | Track bugs and tasks discovered during reviews |
| Checks and statuses   | Report on code quality and test results        |
| Actions and workflows | Monitor CI/CD pipelines and deployment status  |

All permissions follow the principle of least privilege.

## Troubleshooting

- Agent can't access repository 
- Permission denied for pull requests 
- App not visible in GitHub settings 

## Next steps

Once your GitHub integration is connected, configure the features that use it:

- [Bugbot](#) — automated PR reviews that catch bugs and security issues
- [Cloud Agents](#) — AI agents that run in the cloud on your repositories
